

# Quantum relations and zero-error communication

Dominic Verdon

Workshop on quantum graphs, Saarland University, February  
2025

This talk is based on:

- Verdon, D.; A covariant Stinespring theorem. J. Math. Phys. 63 (9): 091705 [Ver22]
- Verdon, D.; Covariant Quantum Combinatorics with Applications to Zero-Error Communication. Commun. Math. Phys. 405, 51 (2024). [Ver24]
- Allen, R. and Verdon, D.;  $\text{CP}^\infty$  and beyond: 2-categorical dilation theory. Th. Appl. Cat. Vol. 41, No. 50, pp 1783-1811 (2024) [AV24]

and some new work in production now.

# A primer on 2-categories

# The diagrammatic calculus of a 2-category: I

- We will discuss  $C^*$ - and  $W^*$ -2-categories.

# The diagrammatic calculus of a 2-category: I

- We will discuss  $C^*$ - and  $W^*$ -2-categories.
- A 2-category has *objects*, morphisms between the objects (called *1-morphisms*) and morphisms between the 1-morphisms (called *2-morphisms*).

# The diagrammatic calculus of a 2-category: I

- We will discuss  $C^*$ - and  $W^*$ -2-categories.
- A 2-category has *objects*, morphisms between the objects (called *1-morphisms*) and morphisms between the 1-morphisms (called *2-morphisms*).

- 2-categories have a convenient planar diagrammatic calculus that handles composition of these different types of morphism.

# The diagrammatic calculus of a 2-category: I

- We will discuss  $C^*$ - and  $W^*$ -2-categories.
- A 2-category has *objects*, morphisms between the objects (called *1-morphisms*) and morphisms between the 1-morphisms (called *2-morphisms*).

- 2-categories have a convenient planar diagrammatic calculus that handles composition of these different types of morphism.
- This generalises the 'tensor network/tensor diagram' calculus for tensor categories. A tensor category is precisely a 2-category with a single object.

# The diagrammatic calculus of a 2-category: II

- We represent objects  $r, s, \dots$  as planar regions:

## The diagrammatic calculus of a 2-category: II

- We represent objects  $r, s, \dots$  as planar regions:

- 1-morphisms  $X : r \rightarrow s$  are wires separating the  $r$ -region on the left from the  $s$ -region on the right:

The identity 1-morphism  $\mathbb{1}_r : r \rightarrow r$  is invisible.

## The diagrammatic calculus of a 2-category: II

- We represent objects  $r, s, \dots$  as planar regions:

- 1-morphisms  $X : r \rightarrow s$  are wires separating the  $r$ -region on the left from the  $s$ -region on the right:

The identity 1-morphism  $\mathbb{1}_r : r \rightarrow r$  is invisible.

- Composition of 1-morphisms is represented by horizontal juxtaposition, read from left to right:

$$X \otimes Y : r \rightarrow t$$

## The diagrammatic calculus of a 2-category: III

- 2-morphisms  $f : X \rightarrow Y$  are represented by boxes connecting  $X$  below to  $Y$  above. (Identity 2-morphisms are invisible.)

## The diagrammatic calculus of a 2-category: III

- 2-morphisms  $f : X \rightarrow Y$  are represented by boxes connecting  $X$  below to  $Y$  above. (Identity 2-morphisms are invisible.)

- Vertical* composition is read from bottom to top:

$$g \circ f : X \rightarrow Z$$

## The diagrammatic calculus of a 2-category: III

- 2-morphisms  $f : X \rightarrow Y$  are represented by boxes connecting  $X$  below to  $Y$  above. (Identity 2-morphisms are invisible.)

- Vertical* composition is read from bottom to top:

$$g \circ f : X \rightarrow Z$$

- Horizontal* composition is read from left to right:

$$f \otimes g : X_1 \otimes X_2 \rightarrow Y_1 \otimes Y_2$$

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.
- Every 2-morphism  $f : X \rightarrow Y$  has a *dagger*  $f^\dagger : Y \rightarrow X$  satisfying:

$$(f^\dagger)^\dagger = f \quad (g \circ f)^\dagger = f^\dagger \circ g^\dagger \quad (f \otimes g)^\dagger = f^\dagger \otimes g^\dagger$$

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.
- Every 2-morphism  $f : X \rightarrow Y$  has a *dagger*  $f^\dagger : Y \rightarrow X$  satisfying:

$$(f^\dagger)^\dagger = f \quad (g \circ f)^\dagger = f^\dagger \circ g^\dagger \quad (f \otimes g)^\dagger = f^\dagger \otimes g^\dagger$$

- The dagger is represented diagrammatically by flipping the diagram in a horizontal axis:

$$\left( r \begin{array}{c} |Y \\ \boxed{f} \\ |X \end{array} s \right)^\dagger = r \begin{array}{c} |X \\ \boxed{f} \\ |Y \end{array} s$$

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.
- Every 2-morphism  $f : X \rightarrow Y$  has a *dagger*  $f^\dagger : Y \rightarrow X$  satisfying:

$$(f^\dagger)^\dagger = f \quad (g \circ f)^\dagger = f^\dagger \circ g^\dagger \quad (f \otimes g)^\dagger = f^\dagger \otimes g^\dagger$$

- The dagger is represented diagrammatically by flipping the diagram in a horizontal axis:

$$\left( r \begin{array}{c} |Y \\ \boxed{f} \\ |X \end{array} s \right)^\dagger = r \begin{array}{c} |X \\ \boxed{f} \\ |Y \end{array} s$$

- A 2-morphism  $f : X \rightarrow Y$  is

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.
- Every 2-morphism  $f : X \rightarrow Y$  has a *dagger*  $f^\dagger : Y \rightarrow X$  satisfying:

$$(f^\dagger)^\dagger = f \quad (g \circ f)^\dagger = f^\dagger \circ g^\dagger \quad (f \otimes g)^\dagger = f^\dagger \otimes g^\dagger$$

- The dagger is represented diagrammatically by flipping the diagram in a horizontal axis:

$$\left( r \begin{array}{c} |Y \\ \boxed{f} \\ |X \end{array} s \right)^\dagger = r \begin{array}{c} |X \\ \boxed{f} \\ |Y \end{array} s$$

- A 2-morphism  $f : X \rightarrow Y$  is
  - an *isometry* if  $f^\dagger \circ f = \text{id}_X$ , and

## Dagger 2-categories

- A *dagger* structure on a 2-category generalises the Hermitian adjoint of linear maps between Hilbert spaces.
- Every 2-morphism  $f : X \rightarrow Y$  has a *dagger*  $f^\dagger : Y \rightarrow X$  satisfying:

$$(f^\dagger)^\dagger = f \quad (g \circ f)^\dagger = f^\dagger \circ g^\dagger \quad (f \otimes g)^\dagger = f^\dagger \otimes g^\dagger$$

- The dagger is represented diagrammatically by flipping the diagram in a horizontal axis:

$$\left( r \begin{array}{c} |Y \\ \boxed{f} \\ |X \end{array} s \right)^\dagger = r \begin{array}{c} |X \\ \boxed{f} \\ |Y \end{array} s$$

- A 2-morphism  $f : X \rightarrow Y$  is
  - an *isometry* if  $f^\dagger \circ f = \text{id}_X$ , and
  - a *unitary* if additionally  $f \circ f^\dagger = \text{id}_Y$ .

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:
  - The 2-morphism sets  $\text{Hom}(X, Y)$  are complex vector spaces (in fact, Banach spaces).

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:
  - The 2-morphism sets  $\text{Hom}(X, Y)$  are complex vector spaces (in fact, Banach spaces).
  - Composition (resp. dagger) is linear (resp. antilinear).

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:
  - The 2-morphism sets  $\text{Hom}(X, Y)$  are complex vector spaces (in fact, Banach spaces).
  - Composition (resp. dagger) is linear (resp. antilinear).
  - The space  $\text{End}(X)$  is a unital  $C^*$ -algebra (product=composition, involution=dagger):

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:
  - The 2-morphism sets  $\text{Hom}(X, Y)$  are complex vector spaces (in fact, Banach spaces).
  - Composition (resp. dagger) is linear (resp. antilinear).
  - The space  $\text{End}(X)$  is a unital  $C^*$ -algebra (product=composition, involution=dagger):

- For any  $f : X \rightarrow Y$ ,  $f^\dagger \circ f$  is a positive element of  $\text{End}(X)$ .

## $C^*$ - and $W^*$ -2-categories

- We say that a dagger 2-category is a  $C^*$ -2-category if it has some extra structure. In particular:
  - The 2-morphism sets  $\text{Hom}(X, Y)$  are complex vector spaces (in fact, Banach spaces).
  - Composition (resp. dagger) is linear (resp. antilinear).
  - The space  $\text{End}(X)$  is a unital  $C^*$ -algebra (product=composition, involution=dagger):

- For any  $f : X \rightarrow Y$ ,  $f^\dagger \circ f$  is a positive element of  $\text{End}(X)$ .
- A  $C^*$ -2-category is a  $W^*$ -2-category if additionally every 2-morphism space  $\text{Hom}(X, Y)$  has a predual. In particular, the endomorphism algebras  $\text{End}(X)$  are  $W^*$ -algebras.

## Rigidity

- In a *rigid*  $C^*$ - or  $W^*$ -2-category, every 1-morphism  $X : r \rightarrow s$  has a *dual* 1-morphism  $X^* : s \rightarrow r$ :

$$r \begin{array}{c} \uparrow \\ X \end{array} s$$

$$s \begin{array}{c} \downarrow \\ X \end{array} r$$

## Rigidity

- In a *rigid*  $C^*$ - or  $W^*$ -2-category, every 1-morphism  $X : r \rightarrow s$  has a *dual* 1-morphism  $X^* : s \rightarrow r$ :

$$\begin{array}{c} \downarrow \\ s \quad \vee \quad r \\ X \end{array}$$

- There are *cup* and *cap* 2-morphisms  $\eta_X : \mathbb{1}_s \rightarrow X^* \otimes X$  and  $\epsilon_X : X \otimes X^* \rightarrow \mathbb{1}_r$ :

# Rigidity

- In a *rigid*  $C^*$ - or  $W^*$ -2-category, every 1-morphism  $X : r \rightarrow s$  has a *dual* 1-morphism  $X^* : s \rightarrow r$ :

$$r \quad \downarrow \quad s \\ \uparrow X$$

$$s \quad \downarrow \quad r \\ \downarrow X$$

- There are *cup* and *cap* 2-morphisms  $\eta_X : \mathbb{1}_s \rightarrow X^* \otimes X$  and  $\epsilon_X : X \otimes X^* \rightarrow \mathbb{1}_r$ :

$$\begin{array}{c} \nearrow r \\ \text{cup} \\ \searrow s \end{array} \quad X$$

$$\begin{array}{c} \text{cap} \\ \nearrow s \end{array} \quad \begin{array}{c} r \\ \searrow X \end{array}$$

- These satisfy the *snake* or *zigzag* equations:

$$\begin{array}{c} r \\ \nearrow \\ \text{cup} \\ \searrow s \end{array} \quad \begin{array}{c} \uparrow \\ \downarrow X \end{array} = \begin{array}{c} r \\ \downarrow \\ \uparrow X \end{array} \quad s$$

$$\begin{array}{c} \downarrow \\ \nearrow s \end{array} \quad \begin{array}{c} r \\ \searrow \\ \text{cap} \end{array} \quad \begin{array}{c} \downarrow \\ \uparrow X \end{array} = \begin{array}{c} s \\ \downarrow \\ \downarrow X \end{array} \quad r$$

# Sliding equations

We can slide the 2-morphisms around cups and caps:

# Categorical quantum mechanics

# Rigid $W^*$ -tensor categories

- A rigid  $W^*$ -tensor category  $\mathcal{T}$  encodes symmetry.
- A  $W^*$ -tensor category is a  $W^*$ -2-category with a single object.
- Conventionally we ignore the single object:
  - 1-morphisms = objects

## Rigid $W^*$ -tensor categories

- A rigid  $W^*$ -tensor category  $\mathcal{T}$  encodes symmetry.
- A  $W^*$ -tensor category is a  $W^*$ -2-category with a single object.
- Conventionally we ignore the single object:
  - 1-morphisms = objects
  - 1-morphism composition = ‘tensor product’.

# Rigid $W^*$ -tensor categories

- A rigid  $W^*$ -tensor category  $\mathcal{T}$  encodes symmetry.
- A  $W^*$ -tensor category is a  $W^*$ -2-category with a single object.
- Conventionally we ignore the single object:
  - 1-morphisms = objects
  - 1-morphism composition = 'tensor product'.
- Motivating example: the category  $\text{Rep}_{fd}(G)$  of finite-dimensional unitary representations of a compact quantum group  $G$ .

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .
- A  $W^*$ -category is *semisimple* if:

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .
- A  $W^*$ -category is *semisimple* if:
  - It has a direct sum (a.k.a. dagger biproduct).

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .
- A  $W^*$ -category is *semisimple* if:
  - It has a direct sum (a.k.a. dagger biproduct).
  - Every object is unitarily isomorphic to a finite direct sum of simple objects  $\{X_i\}_{i \in I}$ .

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .
- A  $W^*$ -category is *semisimple* if:
  - It has a direct sum (a.k.a. dagger biproduct).
  - Every object is unitarily isomorphic to a finite direct sum of simple objects  $\{X_i\}_{i \in I}$ .
- We write

$$X \cong \bigoplus_{i \in I} d_i \cdot X_i$$

where  $d_i$  is the *multiplicity* of the simple object  $X_i$  in the direct sum.

# Semisimplicity

- The Hom-categories  $\text{Hom}(r, s)$  in a  $W^*$ -2-category are  $W^*$ -categories.
- An object  $X$  in a  $W^*$ -category is called *simple* if  $\text{End}(X) \cong \mathbb{C}$ .
- A  $W^*$ -category is *semisimple* if:
  - It has a direct sum (a.k.a. dagger biproduct).
  - Every object is unitarily isomorphic to a finite direct sum of simple objects  $\{X_i\}_{i \in I}$ .
- We write

$$X \cong \bigoplus_{i \in I} d_i \cdot X_i$$

where  $d_i$  is the *multiplicity* of the simple object  $X_i$  in the direct sum.

- Example: rigid  $W^*$ -tensor categories.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
- 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:
  - Objects: f.d.  $G$ - $W^*$ -algebras.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:
  - Objects: f.d.  $G$ - $W^*$ -algebras.
  - 1-morphisms:  $G$ -equivariant bimodules.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:
  - Objects: f.d.  $G$ - $W^*$ -algebras.
  - 1-morphisms:  $G$ -equivariant bimodules.
  - 2-morphisms:  $G$ -equivariant bimodule maps.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:
  - Objects: f.d.  $G$ - $W^*$ -algebras.
  - 1-morphisms:  $G$ -equivariant bimodules.
  - 2-morphisms:  $G$ -equivariant bimodule maps.
- This completion can also be defined in terms of *Q-systems*.

## Q-system completion

- Rigid  $W^*$ -tensor category  $\mathcal{T} \rightarrow$  rigid  $W^*$ -2-category  $\text{Mod}_{fd}(\mathcal{T})$ , defined as follows:
  - Objects: 'Finite-dimensional' left  $\mathcal{T}$ -module  $W^*$ -categories  $\mathcal{M}, \mathcal{N}, \dots$ :

$$\overline{\otimes} : \mathcal{T} \times \mathcal{M} \rightarrow \mathcal{M}$$

- 1-morphisms  $X, Y, \dots : \mathcal{M} \rightarrow \mathcal{N}$ :  $\mathcal{T}$ -module functors.
  - 2-morphisms  $f, g, \dots : X \rightarrow Y$ : natural transformations of  $\mathcal{T}$ -module functors.
- If  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  for CQG  $G$  then  $\text{Mod}(\mathcal{T})$  is the finite-dimensional equivariant Morita 2-category:
  - Objects: f.d.  $G$ - $W^*$ -algebras.
  - 1-morphisms:  $G$ -equivariant bimodules.
  - 2-morphisms:  $G$ -equivariant bimodule maps.
- This completion can also be defined in terms of *Q-systems*.
- See [DR18][CHPJP22][Ver22].

## Yoneda embedding of $\mathcal{T}$ in $\text{Mod}_{fd}(\mathcal{T})$

- The rigid  $W^*$ -tensor category  $\mathcal{T}$  is a module category over itself, where  $\mathcal{T}$  acts by tensor on the left.

## Yoneda embedding of $\mathcal{T}$ in $\text{Mod}_{fd}(\mathcal{T})$

- The rigid  $W^*$ -tensor category  $\mathcal{T}$  is a module category over itself, where  $\mathcal{T}$  acts by tensor on the left.
- Acting by tensor on the right yields a tensor equivalence

$$\text{End}_{\mathcal{T}}(\mathcal{T}) \simeq \mathcal{T}$$

so  $\mathcal{T}$  lives in  $\text{Mod}(\mathcal{T})$  as the category of 1-morphisms  $\mathcal{T} \rightarrow \mathcal{T}$ .

## Yoneda embedding of $\mathcal{T}$ in $\text{Mod}_{fd}(\mathcal{T})$

- The rigid  $W^*$ -tensor category  $\mathcal{T}$  is a module category over itself, where  $\mathcal{T}$  acts by tensor on the left.
- Acting by tensor on the right yields a tensor equivalence

$$\text{End}_{\mathcal{T}}(\mathcal{T}) \simeq \mathcal{T}$$

so  $\mathcal{T}$  lives in  $\text{Mod}(\mathcal{T})$  as the category of 1-morphisms  $\mathcal{T} \rightarrow \mathcal{T}$ .

- There is an equivalence of module categories

$$\mathcal{M} \simeq \text{Hom}_{\mathcal{T}}(\mathcal{T}, \mathcal{M})$$

so  $\mathcal{M}$  lives in  $\text{Mod}(\mathcal{T})$  as the category of 1-morphisms  $\mathcal{T} \rightarrow \mathcal{M}$ .

## Yoneda embedding of $\mathcal{T}$ in $\text{Mod}_{fd}(\mathcal{T})$

- The rigid  $W^*$ -tensor category  $\mathcal{T}$  is a module category over itself, where  $\mathcal{T}$  acts by tensor on the left.
- Acting by tensor on the right yields a tensor equivalence

$$\text{End}_{\mathcal{T}}(\mathcal{T}) \simeq \mathcal{T}$$

so  $\mathcal{T}$  lives in  $\text{Mod}(\mathcal{T})$  as the category of 1-morphisms  $\mathcal{T} \rightarrow \mathcal{T}$ .

- There is an equivalence of module categories

$$\mathcal{M} \simeq \text{Hom}_{\mathcal{T}}(\mathcal{T}, \mathcal{M})$$

so  $\mathcal{M}$  lives in  $\text{Mod}(\mathcal{T})$  as the category of 1-morphisms  $\mathcal{T} \rightarrow \mathcal{M}$ .

- The module action is by composition in  $\text{Mod}(\mathcal{T})$ :

$$\mathcal{T} \uparrow_V \mathcal{T} \uparrow_X \mathcal{M} \cong \mathcal{T} \uparrow_{V \otimes X} \mathcal{M}$$

# Finite-dimensional $\mathcal{T}$ -systems

## Definition

We say that an object  $X$  of a  $\mathcal{T}$ -module category  $\mathcal{M}$  is *generating* if, for every object  $Y$  of  $\mathcal{M}$ , there exists some  $V \in \mathcal{T}$  and an isometry  $\iota : Y \rightarrow V \overline{\otimes} X$ .

# Finite-dimensional $\mathcal{T}$ -systems

## Definition

We say that an object  $X$  of a  $\mathcal{T}$ -module category  $\mathcal{M}$  is *generating* if, for every object  $Y$  of  $\mathcal{M}$ , there exists some  $V \in \mathcal{T}$  and an isometry  $\iota : Y \rightarrow V \otimes X$ .

## Definition ( $\mathcal{T}$ -systems)

- We call an equivalence class of objects in  $\text{Mod}_{fd}(\mathcal{T})$  (i.e. an equivalence class of  $\mathcal{T}$ -module categories) a  *$\mathcal{T}$ -Morita class*.

# Finite-dimensional $\mathcal{T}$ -systems

## Q-systems

- A  $\mathcal{T}$ -system  $X : \mathcal{T} \rightarrow \mathcal{M}$  induces an algebra  $X \otimes X^*$  in  $\mathcal{T}$ , called a *Q-system*, whose multiplication and unit are defined using rigidity:

- Let  $X : \mathcal{T} \rightarrow \mathcal{M}_1$ ,  $Y : \mathcal{T} \rightarrow \mathcal{M}_2$  be  $\mathcal{T}$ -systems. A CP map  $X \rightarrow Y$  can equivalently be defined as a map between Q-systems (c.f. [Sel07]):

- Q-system dynamics is in the Schrodinger picture: channels are trace preserving rather than unital.

# Quantum relations

# Quantum relations

- Two levels of composition:

# Quantum relations

- Two levels of composition:
  - The horizontal, 1-morphism level depends only on the Morita class of the  $\mathcal{T}$ -system.

# Quantum relations

- Two levels of composition:
  - The horizontal, 1-morphism level depends only on the Morita class of the  $\mathcal{T}$ -system.
  - The vertical, 2-morphism level depends on the  $\mathcal{T}$ -system itself.

# Quantum relations

- Two levels of composition:
  - The horizontal, 1-morphism level depends only on the Morita class of the  $\mathcal{T}$ -system.
  - The vertical, 2-morphism level depends on the  $\mathcal{T}$ -system itself.
- In this talk we'll look closely at the 1-morphisms, which we'll interpret as *abstract quantum relations*.

# Quantum relations

- Two levels of composition:
  - The horizontal, 1-morphism level depends only on the Morita class of the  $\mathcal{T}$ -system.
  - The vertical, 2-morphism level depends on the  $\mathcal{T}$ -system itself.
- In this talk we'll look closely at the 1-morphisms, which we'll interpret as *abstract quantum relations*.
- Forthcoming work: objects  $\mathcal{M}$  can be interpreted as *equivalence classes of reference frames*. Simple objects of  $\mathcal{M}$  are *classical types* associated with the frame.

# Functors as abstract quantum relations

- The objects of  $\text{Mod}_{fd}(\mathcal{T})$  are *semisimple* module categories.

## Functors as abstract quantum relations

- The objects of  $\text{Mod}_{fd}(\mathcal{T})$  are *semisimple* module categories.
- A functor between semisimple categories is a lot like a relation:

## Functors as abstract quantum relations

- The objects of  $\text{Mod}_{fd}(\mathcal{T})$  are *semisimple* module categories.
- A functor between semisimple categories is a lot like a relation:
  - Completely determined by the simple objects.

## Functors as abstract quantum relations

- The objects of  $\text{Mod}_{fd}(\mathcal{T})$  are *semisimple* module categories.
- A functor between semisimple categories is a lot like a relation:
  - Completely determined by the simple objects.
  - Simple objects will be mapped to a direct sum of simple objects.

## Functors as abstract quantum relations

- The objects of  $\text{Mod}_{fd}(\mathcal{T})$  are *semisimple* module categories.
- A functor between semisimple categories is a lot like a relation:
  - Completely determined by the simple objects.
  - Simple objects will be mapped to a direct sum of simple objects.
- This can be seen as a quantum relation between the sets of simple objects, where each pairing is assigned a multiplicity/dimension:

$$\begin{pmatrix} X_1 \mapsto Y_1 \oplus Y_1 \oplus Y_2 \\ X_2 \mapsto Y_2 \oplus Y_2 \oplus Y_2 \end{pmatrix}$$

## Functors as abstract quantum relations

$$\begin{pmatrix} X_1 \mapsto Y_1 \oplus Y_1 \oplus Y_2 \\ X_2 \mapsto Y_2 \oplus Y_2 \oplus Y_2 \end{pmatrix}$$

- When  $\mathcal{T} \simeq \text{Rep}_{fd}(G)$  the 1-morphisms are equivariant bimodules (c.f. [Wea12]).

# Quantum relations between $\mathcal{T}$ -systems

- We want relations to go between  $\mathcal{T}$ -systems and not just  $\mathcal{T}$ -Morita classes.

## Quantum relations between $\mathcal{T}$ -systems

- We want relations to go between  $\mathcal{T}$ -systems and not just  $\mathcal{T}$ -Morita classes.
- The problem with abstract quantum relations can be seen by composition of two classical relations:

## Quantum relations between $\mathcal{T}$ -systems

- We want relations to go between  $\mathcal{T}$ -systems and not just  $\mathcal{T}$ -Morita classes.
- The problem with abstract quantum relations can be seen by composition of two classical relations:

- To solve this problem we must take account of the 2-morphism structure.

## Covariant Choi's theorem

- Using rigidity, CP maps  $X \rightarrow Y$  can be identified with positive operators in the  $W^*$ -algebra  $\text{End}(X^* \otimes Y)$ :

## Covariant Choi's theorem

- Using rigidity, CP maps  $X \rightarrow Y$  can be identified with positive operators in the  $W^*$ -algebra  $\text{End}(X^* \otimes Y)$ :

This is a bijective correspondence (in fact, an isomorphism of convex cones).

## Covariant Choi's theorem

- Using rigidity, CP maps  $X \rightarrow Y$  can be identified with positive operators in the  $W^*$ -algebra  $\text{End}(X^* \otimes Y)$ :

This is a bijective correspondence (in fact, an isomorphism of convex cones).

- Notation: If  $\Phi : X \rightarrow Y$  is a CP map, then  $\tilde{\Phi} \in \text{End}(X^* \otimes Y)$  is the associated positive operator.

## Quantum relations

- Let  $X, Y$  be  $\mathcal{T}$ -systems. We define a *quantum relation*  $X \rightarrow Y$  to be a projection  $\tilde{\pi} \in \text{End}(X^* \otimes Y)$ .

## Quantum relations

- Let  $X, Y$  be  $\mathcal{T}$ -systems. We define a *quantum relation*  $X \rightarrow Y$  to be a projection  $\tilde{\pi} \in \text{End}(X^* \otimes Y)$ .
- Notice that (by idempotent splitting) every projection has an underlying abstract relation:

The diagram illustrates the decomposition of a quantum relation into an abstract relation and an idempotent. On the left, a quantum relation  $\pi$  is represented as a box between two  $\mathcal{T}$ -systems  $M_1$  and  $M_2$ . The top wires are labeled  $X$  and  $Y$ , and the bottom wires are also labeled  $X$  and  $Y$ . The box is labeled  $\pi$ . On the right, the same quantum relation is shown as a composition of two boxes. The top box is labeled  $\iota$  and the bottom box is labeled  $\iota$ . The middle box is labeled  $E$ . The top wires are labeled  $X$  and  $Y$ , and the bottom wires are also labeled  $X$  and  $Y$ . The boxes are labeled  $M_1$  and  $M_2$ . The equation is  $M_1 \xrightarrow{\pi} M_2 = M_1 \xrightarrow{\iota} M_2 \xrightarrow{\iota}$ .

## Quantum relations

- Let  $X, Y$  be  $\mathcal{T}$ -systems. We define a *quantum relation*  $X \rightarrow Y$  to be a projection  $\tilde{\pi} \in \text{End}(X^* \otimes Y)$ .
- Notice that (by idempotent splitting) every projection has an underlying abstract relation:

$$\begin{array}{c}
 \begin{array}{c} X \downarrow \quad \uparrow Y \\ \mathcal{M}_1 \quad \boxed{\pi} \quad \mathcal{M}_2 \\ \downarrow \quad \uparrow \\ X \downarrow \quad \uparrow Y \end{array} \\
 \end{array} = \begin{array}{c}
 \begin{array}{c} X \downarrow \quad \uparrow Y \\ \mathcal{M}_1 \quad \boxed{\iota} \quad \mathcal{M}_2 \\ \uparrow E \\ \boxed{\iota} \\ X \downarrow \quad \uparrow Y \end{array}
 \end{array}$$

- Being a positive operator in the Choi space, a quantum relation  $\tilde{\pi}$  is also a CP map  $\pi : X \rightarrow Y$ :

$$\begin{array}{c}
 X \downarrow \quad \uparrow Y \\
 \mathcal{M}_1 \quad \boxed{\iota} \quad \mathcal{M}_2 \\
 \uparrow E \\
 \boxed{\iota} \\
 \downarrow \quad \uparrow Y
 \end{array}$$

## Quantum relations

- Let  $X, Y$  be  $\mathcal{T}$ -systems. We define a *quantum relation*  $X \rightarrow Y$  to be a projection  $\tilde{\pi} \in \text{End}(X^* \otimes Y)$ .
- Notice that (by idempotent splitting) every projection has an underlying abstract relation:

The diagram shows an equality between two expressions. On the left, a box labeled  $\pi$  is connected to  $X$  and  $Y$  by four vertical lines, each labeled  $\mathcal{T}$ . The box is also connected to  $\mathcal{M}_1$  and  $\mathcal{M}_2$  by two vertical lines. On the right, the same box  $\pi$  is shown, but it is decomposed into two boxes labeled  $\iota$  and  $E$ . The box  $\iota$  is connected to  $X$  and  $Y$  by two vertical lines, each labeled  $\mathcal{T}$ . The box  $E$  is connected to  $\mathcal{M}_1$  and  $\mathcal{M}_2$  by two vertical lines. The entire expression is set equal to the right-hand side.

- Being a positive operator in the Choi space, a quantum relation  $\tilde{\pi}$  is also a CP map  $\pi : X \rightarrow Y$ :

The diagram shows a box labeled  $\pi$  connected to  $X$  and  $Y$  by two vertical lines, each labeled  $\mathcal{T}$ . The box is also connected to  $\mathcal{M}_1$  and  $\mathcal{M}_2$  by two vertical lines. A curved arrow labeled  $\mathcal{T}$  points from the  $X$  line to the  $Y$  line, indicating the CP map structure.

- C.f. [Kor20].

## Underlying relations

# The underlying quantum relation of a CP map

- Every CP map  $\Phi : X \rightarrow Y$  has a minimal dilation  $(E, f)$ . The minimal dilation is unique up to unitary isomorphism.

## The underlying quantum relation of a CP map

- Every CP map  $\Phi : X \rightarrow Y$  has a minimal dilation  $(E, f)$ . The minimal dilation is unique up to unitary isomorphism.
- The *underlying quantum relation*  $\mathfrak{K}(\Phi) : X \rightarrow Y$  of the CP map is defined using the Choi isomorphism:

# Motivation

- What does the underlying quantum relation of a channel tell us about the channel?

# Motivation

- What does the underlying quantum relation of a channel tell us about the channel?
- Classical zero-error communication theory [Sha56]:

# Motivation

- What does the underlying quantum relation of a channel tell us about the channel?
- Classical zero-error communication theory [Sha56]:

- The underlying quantum relation should tell us about zero-error properties, such as reversibility.

# Motivation

- What does the underlying quantum relation of a channel tell us about the channel?
- Classical zero-error communication theory [Sha56]:

- The underlying quantum relation should tell us about zero-error properties, such as reversibility.
- We will first show functoriality of  $\mathfrak{R}$ .

# The category of CP maps

- The category  $\mathcal{T}\text{-CP}$  has:

# The category of CP maps

- The category  $\mathcal{T}\text{-CP}$  has:
  - Objects:  $\mathcal{T}$ -systems

# The category of CP maps

- The category  $\mathcal{T}\text{-CP}$  has:
  - Objects:  $\mathcal{T}$ -systems
  - Morphisms: CP maps

# The category of CP maps

- The category  $\mathcal{T}\text{-CP}$  has:
  - Objects:  $\mathcal{T}$ -systems
  - Morphisms: CP maps
- There are subcategories  $\mathcal{T}\text{-Alg} \subset \mathcal{T}\text{-Chan} \subset \mathcal{T}\text{-CP}$  whose morphisms are unital  $*$ -homomorphisms and channels respectively.

## The category of CP maps

- The category  $\mathcal{T}\text{-CP}$  has:
  - Objects:  $\mathcal{T}$ -systems
  - Morphisms: CP maps
- There are subcategories  $\mathcal{T}\text{-Alg} \subset \mathcal{T}\text{-Chan} \subset \mathcal{T}\text{-CP}$  whose morphisms are unital  $*$ -homomorphisms and channels respectively.
- $\mathcal{T}\text{-CP}$  has a dagger structure which is *not* inherited by these two subcategories. This takes a CP map  $X \rightarrow Y$  with dilation  $(E, f)$  to a CP map  $Y \rightarrow X$  with the following dilation:

This is known as the *adjoint* of a CP map.

## The category of quantum relations

- Let  $\pi_1 : X \rightarrow Y$ ,  $\pi_2 : Y \rightarrow Z$  be quantum relations. We define the composition  $\pi_2 \circ_R \pi_1 : X \rightarrow Z$  as follows:

$$\begin{array}{c} X \downarrow \quad \uparrow Z \\ \mathcal{M}_1 \quad \tau \quad \mathcal{M}_3 \\ \downarrow \quad \uparrow \\ X \downarrow \quad \uparrow Z \end{array} \quad \pi_1 \circ_R \pi_2 \quad \mathcal{M}_3 \quad := \quad \text{supp} \left( \begin{array}{c} X \downarrow \quad \uparrow Z \\ \mathcal{M}_1 \quad \tau \quad \mathcal{M}_2 \quad \tau \quad \mathcal{M}_3 \\ \downarrow \quad \uparrow \\ X \downarrow \quad \uparrow Z \end{array} \right)$$

The diagram on the left shows a box labeled  $\pi_1 \circ_R \pi_2$  with inputs  $X$  and  $Z$  and outputs  $X$  and  $Z$ . The diagram on the right shows the support of the composition, which is a box labeled  $\pi_1$  with input  $X$  and output  $Y$ , and a box labeled  $\pi_2$  with input  $Y$  and output  $Z$ . The boxes are connected by a circular arrow labeled  $\tau$ .

## The category of quantum relations

- Let  $\pi_1 : X \rightarrow Y$ ,  $\pi_2 : Y \rightarrow Z$  be quantum relations. We define the composition  $\pi_2 \circ_R \pi_1 : X \rightarrow Z$  as follows:

$$\mathcal{M}_1 \begin{array}{c} X \downarrow \\ \tau \\ \pi_1 \circ_R \pi_2 \\ \tau \\ X \downarrow \\ Z \uparrow \end{array} \mathcal{M}_3 := \text{supp} \left( \begin{array}{c} X \downarrow \\ \tau \\ \pi_1 \\ Y \uparrow \\ \tau \\ Y \downarrow \\ \pi_2 \\ Z \uparrow \\ \tau \\ Z \downarrow \end{array} \right)$$

- The identity relation  $\Delta_X : X \rightarrow X$  is defined as follows:

$$\begin{array}{c} \tau \\ \Delta_X \\ \tau \end{array} X$$

## The category of quantum relations

- Let  $\pi_1 : X \rightarrow Y$ ,  $\pi_2 : Y \rightarrow Z$  be quantum relations. We define the composition  $\pi_2 \circ_R \pi_1 : X \rightarrow Z$  as follows:

$$\mathcal{M}_1 \begin{array}{c} X \downarrow \quad \uparrow Z \\ \tau \quad \tau \\ \boxed{\pi_1 \circ_R \pi_2} \\ X \downarrow \quad \uparrow Z \\ \tau \quad \tau \end{array} \mathcal{M}_3 := \text{supp} \left( \begin{array}{c} X \downarrow \quad \uparrow Z \\ \tau \quad \tau \\ \mathcal{M}_1 \boxed{\pi_1} \mathcal{M}_2 \boxed{\pi_2} \mathcal{M}_3 \\ \tau \quad \tau \\ X \downarrow \quad \uparrow Z \\ \tau \quad \tau \end{array} \right)$$

The diagram on the right shows a circular structure with two boxes labeled  $\pi_1$  and  $\pi_2$ . The box  $\pi_1$  has an incoming wire from  $X$  and an outgoing wire to  $Y$ . The box  $\pi_2$  has an incoming wire from  $Y$  and an outgoing wire to  $Z$ . The wires are labeled with  $\tau$  at the top and bottom. The entire structure is enclosed in large parentheses with the word "supp" to its left.

- The identity relation  $\Delta_X : X \rightarrow X$  is defined as follows:

$$\begin{array}{c} \tau \quad X \\ \curvearrowleft \\ \textcircled{\Delta_X} \quad \mathcal{M} \\ \curvearrowright \tau \quad X \end{array}$$

The diagram shows a box labeled  $\Delta_X$  with a dashed border. It has two wires entering from the top and two wires exiting from the bottom. The top wires are labeled  $\tau$  and  $X$ , and the bottom wires are labeled  $\tau$  and  $X$ . The box is labeled  $\mathcal{M}$  to its right.

- The resulting category  $\mathcal{T}\text{-Rel}$  has a dagger — the *converse*:

$$\begin{array}{c} X \downarrow \quad \uparrow Y \\ \boxed{\pi} \\ X \downarrow \quad \uparrow Y \end{array} \mapsto \begin{array}{c} Y \downarrow \quad \uparrow X \\ \boxed{\pi} \\ Y \downarrow \quad \uparrow X \end{array}$$

The diagram shows a mapping between two boxes labeled  $\pi$ . The left box has two wires entering from the top (labeled  $X$  and  $Y$ ) and two wires exiting from the bottom (labeled  $X$  and  $Y$ ). The right box has two wires entering from the top (labeled  $Y$  and  $X$ ) and two wires exiting from the bottom (labeled  $Y$  and  $X$ ). The mapping is indicated by a double arrow  $\mapsto$ .

# The underlying quantum relation of a CP map

## Proposition ([Ver24, Prop. 3.5])

*There is a full and faithful identity-on-objects dagger functor  $\mathfrak{R} : \mathcal{T}\text{-CP} \rightarrow \mathcal{T}\text{-Rel}$ , which sends a CP map to its underlying relation.*

# The underlying quantum relation of a CP map

## Proposition ([Ver24, Prop. 3.5])

*There is a full and faithful identity-on-objects dagger functor  $\mathfrak{R} : \mathcal{T}\text{-CP} \rightarrow \mathcal{T}\text{-Rel}$ , which sends a CP map to its underlying relation.*

### Proof.

- The nontrivial part is showing that composition is preserved; that is, for  $\Phi : X \rightarrow Y$ ,  $\Psi : Y \rightarrow Z$  we have  $\mathfrak{R}(\Psi \circ \Phi) = \mathfrak{R}(\Psi) \circ_R \mathfrak{R}(\Phi)$ .

# The underlying quantum relation of a CP map

## Proposition ([Ver24, Prop. 3.5])

*There is a full and faithful identity-on-objects dagger functor  $\mathfrak{R} : \mathcal{T}\text{-CP} \rightarrow \mathcal{T}\text{-Rel}$ , which sends a CP map to its underlying relation.*

### Proof.

- The nontrivial part is showing that composition is preserved; that is, for  $\Phi : X \rightarrow Y$ ,  $\Psi : Y \rightarrow Z$  we have  $\mathfrak{R}(\Psi \circ \Phi) = \mathfrak{R}(\Psi) \circ_R \mathfrak{R}(\Phi)$ .
- This comes down to equality of the supports

$$s \left( \begin{array}{c} X \downarrow \\ \mathcal{M}_1 \text{---} \tilde{\Phi} \text{---} \mathcal{M}_2 \text{---} \tilde{\Psi} \text{---} \mathcal{M}_3 \\ X \downarrow \end{array} \right) = s \left( \begin{array}{c} X \downarrow \\ \mathcal{M}_1 \text{---} s(\tilde{\Phi}) \text{---} \mathcal{M}_2 \text{---} s(\tilde{\Psi}) \text{---} \mathcal{M}_3 \\ X \downarrow \end{array} \right)$$

# Quantum graphs

# Quantum graphs

- A quantum graph  $\Gamma : X \rightarrow X$  is a *symmetric relation* [Wea21].

# Quantum graphs

- A quantum graph  $\Gamma : X \rightarrow X$  is a *symmetric relation* [Wea21].
- By dagger functoriality of  $\mathfrak{R}$ , this can be expressed by  $\Gamma^\dagger = \Gamma$ ; or, in the Choi space,  $\tilde{\Gamma}^T = \tilde{\Gamma}$ .

# Quantum graphs

- A quantum graph  $\Gamma : X \rightarrow X$  is a *symmetric relation* [Wea21].
- By dagger functoriality of  $\mathfrak{R}$ , this can be expressed by  $\Gamma^\dagger = \Gamma$ ; or, in the Choi space,  $\widetilde{\Gamma}^T = \widetilde{\Gamma}$ .
- Examples: *discrete* and *complete* confusability graphs:

$$\widetilde{\Delta}_X := \begin{array}{c} \text{ } \\ \text{ } \end{array}$$

The diagram for  $\widetilde{\Delta}_X$  consists of a central dashed circle labeled  $d_X^{-1}$ . To its left is the object  $M$  and to its right is the object  $X$ . Two curved arrows, both labeled  $\tau$ , connect the top of the circle to the top of  $X$  and the bottom of the circle to the bottom of  $X$ .

$$\widetilde{\kappa}_X := \begin{array}{c} \text{ } \\ \text{ } \end{array}$$

The diagram for  $\widetilde{\kappa}_X$  consists of two vertical lines. The left line starts at object  $M$  at the top and ends at object  $X$  at the bottom. The right line starts at object  $X$  at the bottom and ends at object  $M$  at the top. The two lines are connected at their intersection by a horizontal line segment labeled  $\tau$ .

- A quantum graph  $\Gamma : X \rightarrow X$  is *confusability* if  $\widetilde{\Delta}_X < \widetilde{\Gamma}$ , or *simple* if  $\widetilde{\Delta}_X \perp \widetilde{\Gamma}$ .

## The confusability graph of a channel

In classical zero-error communication, we often need even less information than the underlying relation [Sha56]:

## The confusability graph of a channel

In classical zero-error communication, we often need even less information than the underlying relation [Sha56]:

### Proposition ([Ver24, Prop. 3.11])

Let  $\Phi : X \rightarrow Y$  be a CP morphism. Then  $\mathfrak{R}(\Phi \circ \Phi^\dagger) : Y \rightarrow Y$  is a quantum graph. It is a confusability graph iff  $\Phi$  is a channel.

## The confusability graph of a channel

In classical zero-error communication, we often need even less information than the underlying relation [Sha56]:

### Proposition ([Ver24, Prop. 3.11])

Let  $\Phi : X \rightarrow Y$  be a CP morphism. Then  $\mathfrak{R}(\Phi \circ \Phi^\dagger) : Y \rightarrow Y$  is a quantum graph. It is a confusability graph iff  $\Phi$  is a channel.

- We recover the quantum confusability graphs of channels defined in [DSW13].

## The confusability graph of a channel

In classical zero-error communication, we often need even less information than the underlying relation [Sha56]:

### Proposition ([Ver24, Prop. 3.11])

Let  $\Phi : X \rightarrow Y$  be a CP morphism. Then  $\mathfrak{R}(\Phi \circ \Phi^\dagger) : Y \rightarrow Y$  is a quantum graph. It is a confusability graph iff  $\Phi$  is a channel.

- We recover the quantum confusability graphs of channels defined in [DSW13].
- Alternatively, one can work with the simple complement, called the *distinguishability graph* [Sta16].

# Duan's theorem

Theorem ([Ver24, Prop. 3.12], c.f.[Dua09, Lem. 2])

Let  $\Gamma : Y \rightarrow Y$  be a confusability graph. Then there exists a channel  $\Phi : X \rightarrow Y$  such that  $\Re(\Phi \circ \Phi^\dagger) = \Gamma$ .

Proof.

- $\widetilde{\Delta_Y} < \widetilde{\Gamma} \Rightarrow \widetilde{\Gamma} = \widetilde{\Delta_Y} + (\widetilde{\Gamma} - \widetilde{\Delta_Y})$ . The summands are orthogonal projections; moreover they are symmetric.
- We use the Q-system version of Choi's theorem:

$$\begin{array}{c}
 Y \uparrow \\
 \tau \quad \mathcal{M}_2 \quad \mathcal{M}_2 \quad Y \downarrow \\
 \begin{array}{|c|} \hline f \\ \hline \end{array} \begin{array}{|c|} \hline E \\ \hline \end{array} \begin{array}{|c|} \hline f \\ \hline \end{array} \\
 Y \uparrow \quad Y \downarrow
 \end{array} \tau = \tau \begin{array}{|c|} \hline f \\ \hline \end{array} \begin{array}{|c|} \hline f \\ \hline \end{array} \tau$$

- We get an equality of CP maps  $\Gamma = \Delta_Y + (\Gamma - \Delta_Y)$ , where the summands are self-adjoint CP maps  $Y \rightarrow Y$ .

## Duan's theorem

- We were considering the equality of CP maps  $\Gamma = \Delta_Y + (\Gamma - \Delta_Y)$ .
- We have the following concrete expression for  $\Delta_Y$ :

$$\widetilde{\Delta_Y} = \begin{array}{c} \text{ } \\ \text{ } \end{array} \rightarrow \Delta_Y = \begin{array}{c} \text{ } \end{array}$$

The diagram on the left shows a box labeled  $\mathcal{M}_2$  with a dashed circle containing  $d_X^{-1}$  inside it. Two curved arrows, both labeled  $\tau$ , enter the box from the left and exit from the right. The diagram on the right shows a box labeled  $\mathcal{M}_2$  with a dashed circle containing  $d_X^{-1}$  inside it. Two vertical lines, both labeled  $\tau$ , enter the box from the bottom and exit from the top.

- We observe that  $\Delta_Y$  is a positive invertible operator in  $\text{End}(Y \otimes Y^*)$ .
- Therefore for small enough  $\tau > 0$ , the CP map  $f := \Delta_Y + \tau(\Gamma - \Delta_Y)$  is positive.
- We now go back to the Choi space and consider the positive operator  $\widetilde{f} = \widetilde{\Delta_Y} + \tau(\widetilde{\Gamma} - \widetilde{\Delta_Y}) \in \text{End}(Y^* \otimes Y)$ .

# Duan's theorem

- We were considering the positive operator  $\tilde{f} = \widetilde{\Delta_Y} + \tau(\tilde{\Gamma} - \widetilde{\Delta_Y}) \in \text{End}(Y^* \otimes Y)$ .
- Fact 1: Positivity of  $f$  implies that  $\tilde{f}$  is CP, in the sense that it has a dilation  $\eta : X^* \rightarrow X^* \otimes E$ :

$$\mathcal{M}_2 \begin{array}{c} Y \downarrow \uparrow Y \\ \boxed{\tilde{f}} \\ Y \downarrow \uparrow Y \end{array} \mathcal{M}_2 = \mathcal{M}_2 \begin{array}{c} Y \downarrow \uparrow E \\ \boxed{\eta} \end{array} \begin{array}{c} E \xrightarrow{\tau} \\ \boxed{\eta} \\ Y \downarrow \uparrow Y \end{array} \mathcal{M}_2$$

- Fact 2:  $\tilde{f}$  is furthermore a channel:

$$\mathcal{M}_2 \begin{array}{c} \curvearrowright^Y \\ \boxed{\tilde{f}} \\ \curvearrowleft_Y \end{array} = \mathcal{M}_2 \begin{array}{c} \curvearrowright^Y \\ \boxed{\widetilde{\Delta_Y}} \\ \curvearrowleft_Y \end{array} + \tau \mathcal{M}_2 \begin{array}{c} \curvearrowright^Y \\ \boxed{\tilde{\Gamma} - \widetilde{\Delta_Y}} \\ \curvearrowleft_Y \end{array} = \mathcal{M}_2 \begin{array}{c} \curvearrowright^Y \\ \curvearrowleft_Y \end{array}$$

- Fact 3:  $s(\tilde{f}) = s(\widetilde{\Delta_Y} + \tau(\tilde{\Gamma} - \widetilde{\Delta_Y})) = s(\tilde{\Gamma}) = \tilde{\Gamma}$ .

- We were discussing the positive operator  $\tilde{f} \in \text{End}(Y^* \otimes Y)$ . It has a dilation  $\eta : Y^* \rightarrow Y^* \otimes E$ .
- We define the following CP map  $\Phi : E^* \rightarrow Y$ :

- $\Phi$  is a channel:

- We will finish by showing that its quantum confusability graph is  $\Gamma$ .

# Duan's theorem

- We just defined a channel  $\Phi : E^* \rightarrow Y$ :

- We have

$$\widetilde{\Re(\Phi \circ \Phi^\dagger)} = s \left( \begin{array}{c} \begin{array}{ccc} Y \downarrow & \tau & \uparrow Y \\ \eta & & \eta \\ \eta \downarrow & \tau & \uparrow \eta \\ Y \downarrow & \tau & \uparrow Y \end{array} \\ \mathcal{M}_2 \end{array} \right) = s(\tilde{f}^\dagger \circ \tilde{f}) = s(\tilde{f}) = \tilde{\Gamma}.$$

# More on quantum relations and zero error communication

## Theorem (Reversibility of channels)

*[[Ver24, Thm. 4.4]] Let  $\Phi : Y \rightarrow X$  be a channel. There exists a channel  $\Psi : X \rightarrow Y$  such that  $\Phi \circ \Psi = \text{id}_X$  iff the confusability graph of  $\Phi$  is discrete.*

# More on quantum relations and zero error communication

## Theorem (Reversibility of channels)

*[[Ver24, Thm. 4.4]] Let  $\Phi : Y \rightarrow X$  be a channel. There exists a channel  $\Psi : X \rightarrow Y$  such that  $\Phi \circ \Psi = \text{id}_X$  iff the confusability graph of  $\Phi$  is discrete.*

To state the following theorem we needed  $\mathcal{T}$  to be a braided tensor category to obtain a tensor product of  $\mathcal{T}$ -systems.
